## 0.1 Iterated integral

**Definition 0.1.1.** Chen's *Iterated integral* is defined inductively by

$$\int_a^b f_1(t)dt \cdots f_r(t)dt = \int_a^b \left(\int_a^t f_1( au)d au \cdots f_{r-1}( au)d au
ight)f_r(t)dt$$

It can also be written as

$$\int\limits_{a\leq t_1\leq \cdots \leq t_n\leq b} f_1(t_1)dt_1\wedge \cdots \wedge f_n(t_n)dt_n$$

If  $\alpha:[a,b]\to M$  is a curve,  $\alpha^*\omega_i=f_i(t)dt$ , then

$$\int_{\Omega} \omega_1 \cdots \omega_r = \int_a^b f_1(t) dt \cdots f_r(t) dt$$

Set the integral to be 1 if r = 0

#### Proposition 0.1.2.

1. The iterated integral is independent of the parametrization

2. 
$$\int_{\alpha\beta} \omega_1 \cdots \omega_r = \sum_{j=0}^r \int_{\alpha} \omega_1 \cdots \omega_j \int_{\beta} \omega_{j+1} \cdots \omega_r, \text{ here } \beta(0) = \alpha(1)$$

3. 
$$\int_{\alpha^{-1}} \omega_1 \cdots \omega_r = (-1)^r \int_{\alpha} \omega_r \cdots \omega_1$$

4. 
$$\int_{\alpha} \omega_1 \cdots \omega_r \int_{\alpha} \omega_{r+1} \cdots \omega_{r+s} = \sum_{\sigma} \int_{\alpha} \omega_{\sigma^{-1}(1)} \cdots \omega_{\sigma^{-1}(r+s)}, \text{ here } \sigma \text{ runs over } (r,s) \text{-shuffles}$$

5. If 
$$\omega_i^{(j)}$$
,  $1 \le i \le r$ ,  $1 \le j \le n$  are closed one forms such that  $\sum_j \omega_{i-1}^{(j)} \wedge \omega_i^{(j)} = 0$  for  $2 \le i \le r$ , then  $\int_{\alpha} \sum_j \omega_1^{(j)} \cdots \omega_r^{(j)}$  only depends on the homotopy class of  $\alpha$ 

Proof.

- 1. Suppose  $\beta:[c,d]\to M$  is another parametrization of the same curve as  $\alpha$  with  $\beta^*\omega_i=g_i(s)ds$
- 2.
- 3.
- 4.
- 5.

## 0.2 Polylogarithm

**Definition 0.2.1.** The *Polylogarithms* are

$$\operatorname{Li}_n(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^n}$$

Note that

$$\mathrm{Li}_{n+1}(z) = \int_0^z rac{\mathrm{Li}_n(t)}{t} dt, \quad \mathrm{Li}_1(z) = -\ln(1-z)$$

Hence

$$\operatorname{Li}_n(z) = \int_0^z \left( rac{dt}{t} 
ight)^{n-1} rac{dt}{1-t} = \int_0^1 \left( rac{dt}{t} 
ight)^{n-1} rac{dt}{z^{-1}-t}$$

Dilogarithm  $\text{Li}_2(z) = -\int_0^z \frac{\ln(1-u)}{u} du$  is the analytic continuation on  $\mathbb{C} \setminus \{0,1\}$ , avoiding the the cut  $[1,\infty]$ 

**Lemma 0.2.2.**  $\text{Li}_k(z)$  satisfies differential equation

$$\left[ (1-z)\frac{d}{dz} \right] \left( z\frac{d}{dz} \right)^{k-1} y = 1$$

Other solutions are  $\frac{\ln^j z}{j!}$ ,  $1 \le j \le k-1$ 

To compute the monodromy around x=0, take  $q(\epsilon)$  to be the loop  $x=\epsilon e^{it}$ , we get 0. To compute the monodromy around x=1, take  $q(\epsilon)$  to be the composition of  $x=(1-t)\epsilon+t(1-\epsilon)$ ,  $x=1-\epsilon e^{it}$  and  $x=(1-t)(1-\epsilon)+t\epsilon$ , we get  $-\frac{2\pi i}{(n-1)!}\log^{n-1}x$ 

The variation matrix is

The monodromy representation  $\rho$  is as follows For monodromy around x=0

$$\begin{bmatrix} 1 & & & & \\ & 1 & & & \\ & 1 & & 1 & \\ & \vdots & \vdots & \ddots & \\ & \frac{1}{n!} & \frac{1}{(n-1)!} & \cdots & 1 \end{bmatrix}$$

For monodromy around x = 1

$$\begin{bmatrix} 1 & & & \\ -1 & 1 & & & \\ & & \ddots & \\ & & & 1 \end{bmatrix}$$

## 0.3 Multiple polylogarithm

**Definition 0.3.1.** The multiple polylogarithms are

$$\operatorname{Li}_{\mathbf{n}}(\mathbf{x}) = \sum_{\mathbf{k}} \frac{\mathbf{x}^{\mathbf{k}}}{\mathbf{k}^{\mathbf{n}}} = \int_{0}^{1} \frac{dt}{a_{1} - t} \left(\frac{dt}{t}\right)^{n_{1} - 1} \cdots \frac{dt}{a_{d} - t} \left(\frac{dt}{t}\right)^{n_{d} - 1}$$

Here **k** runs over  $0 < k_1 < \cdots < k_d$ ,  $a_j = a_j(\mathbf{x}) = (x_j \cdots x_d)^{-1}$ 

Define  $\mathrm{Li}_0(x) = \frac{x}{1-x}$ 

Note. For **k** runs over  $(k_1, \dots, k_d) \in \mathbb{Z}_{\geq 1}^d$ 

$$\sum_{\mathbf{k}} rac{\mathbf{x}^{\mathbf{k}}}{\mathbf{k}^{\mathbf{n}}} = \left(\sum_{k_1} rac{x_1^{k_1}}{k_1^{n_1}}
ight) \cdots \left(\sum_{k_d} rac{x_d^{k_d}}{k_d^{n_d}}
ight) = \mathrm{Li}_{n_1}(x_1) \cdots \mathrm{Li}_{n_d}(x_d)$$

Can be written in terms of multiple polylogarithms  $N_{ott}$ 

$$\begin{split} \operatorname{Li}_{n_{1},\cdots,n_{i-1},0,n_{i+1},\cdots,n_{d}}(x_{1},\cdots,x_{d}) &= \sum_{0 < k_{1} < \cdots < k_{d}} \frac{x_{1}^{k-1} \cdots x_{1}^{k_{d}}}{k_{1}^{n_{1}} \cdots k_{i-1}^{n_{i-1}} k_{i+1}^{n_{i+1}} \cdots k_{d}^{n_{d}}} \\ &= \sum_{0 < k_{1} < \cdots < k_{d}} \frac{x_{1}^{k-1} \cdots x_{i-1}^{k_{i-1}} x_{i+1}^{k_{i+1}} \cdots x_{d}^{k_{d}}}{k_{1}^{n_{1}} \cdots k_{i-1}^{n_{i-1}} k_{i+1}^{n_{i+1}} \cdots k_{d}^{n_{d}}} \frac{x_{i}^{k_{i-1}+1} - x_{i}^{k_{i+1}}}{1 - x_{i}} \\ &= \sum_{0 < k_{1} < \cdots < k_{d}} \frac{x_{1}^{k-1} (\cdots x_{i-1} x_{i})^{k_{i-1}} k_{i+1}^{n_{i+1}} \cdots k_{d}^{n_{d}}}{k_{1}^{n_{1}} \cdots k_{i-1}^{n_{i-1}} k_{i+1}^{n_{i+1}} \cdots k_{d}^{n_{d}}} \frac{x_{i}}{1 - x_{i}} \\ &- \sum_{0 < k_{1} < \cdots < k_{d}} \frac{x_{1}^{k-1} \cdots x_{i-1}^{k_{i-1}} (x_{i} x_{i+1})^{k_{i+1}} \cdots k_{d}^{n_{d}}}{k_{1}^{n_{1}} \cdots k_{i-1}^{n_{i-1}} k_{i+1}^{n_{i+1}} \cdots k_{d}^{n_{d}}} \frac{1}{1 - x_{i}} \\ &= \operatorname{Li}_{n_{1}, \cdots, n_{i-1}, n_{i+1}, \cdots, n_{d}}(x_{1}, \cdots, x_{i-1} x_{i}, x_{i+1}, \cdots, x_{d}) \frac{x_{i}}{1 - x_{i}} \\ &- \operatorname{Li}_{n_{1}, \cdots, n_{i-1}, n_{i+1}, \cdots, n_{d}}(x_{1}, \cdots, x_{i-1}, x_{i} x_{i+1}, \cdots, x_{d}) \frac{1}{1 - x_{i}} \end{aligned}$$

$$\mathrm{Li}_{n_1,\cdots,n_{d-1},0}(x_1,\cdots,x_d) = \mathrm{Li}_{n_1,\cdots,n_{d-1}}(x_1,\cdots,x_{d-1}x_d) rac{x_d}{1-x_d}$$

$$\mathrm{Li}_{0,n_2,\cdots,n_d}(x_1,\cdots,x_d) = \mathrm{Li}_{n_2,\cdots,n_{d-1}}(x_2,\cdots,x_d) rac{x_1}{1-x_1} - \mathrm{Li}_{n_2,\cdots,n_{d-1}}(x_1x_2,\cdots,x_d) rac{1}{1-x_1}$$

Exercise 0.3.2 (Derivatives of polylogarithms). Observe the following

$$\frac{\partial}{\partial x_i} \left( \sum_{\mathbf{k}} \frac{\cdots x_{i-1}^{k_{i-1}} x_i^{k_i} x_{i+1}^{k_{i+1}} \cdots}{\cdots k_{i-1}^{n_{i-1}} k_i^{n_i} k_{i+1}^{n_{i+1}} \cdots} \right) = \sum_{\mathbf{k}} \frac{\cdots x_{i-1}^{k_{i-1}} x_i^{k_i} - x_{i+1}^{k_{i+1}} \cdots}{\cdots k_{i-1}^{n_{i-1}} k_i^{n_i} - 1 k_{i+1}^{n_{i+1}} \cdots} \\ = \sum_{\mathbf{k}} \frac{\cdots x_{i-1}^{k_{i-1}} x_i^{k_i} x_{i+1}^{k_{i+1}} \cdots}{\cdots k_{i-1}^{n_{i-1}} k_i^{n_i} - 1 k_{i+1}^{n_{i+1}} \cdots} \frac{1}{x_i}$$

Write  $u_i = \log(x_i)$ ,  $v_i = \log(1 - x_i)$ ,  $u_{ij} = \log(x_i \cdots x_j)$ ,  $v_{ij} = \log(1 - x_i \cdots x_j)$ . If  $m_i > 1$ , then

$$d_i \operatorname{Li}_{n_1,\cdots,n_d}(z_1,\cdots,z_d) = \operatorname{Li}_{n_1,\cdots,n_i-1,\cdots,n_d}(z_1,\cdots,z_d) rac{dx_i}{x_i}$$

$$d_d \operatorname{Li}_{n_1, \cdots, n_{d-1}, 1}(z_1, \cdots, z_d) = \operatorname{Li}_{n_1, \cdots, n_{d-1}}(z_1, \cdots, z_{d-1}z_d) rac{dx_d}{1 - x_d}$$

$$egin{aligned} d_1 \, \mathrm{Li}_{1,n_2,\cdots,n_d}(z_1,\cdots,z_d) &= \mathrm{Li}_{n_2,\cdots,n_d}(z_2,\cdots,z_d) rac{dx_1}{1-x_1} \ &- \mathrm{Li}_{n_2,\cdots,n_d}(z_1 z_2,\cdots,z_d) rac{dx_1}{x_1(1-x_1)} \end{aligned}$$

$$d_i \operatorname{Li}_{n_1,\cdots,n_{i-1},1,n_{i+1},\cdots,n_d}(z_1,\cdots,z_d) = \operatorname{Li}_{n_1,\cdots,n_{i-1},n_{i+1},\cdots,n_d}(z_1,\cdots,z_{i-1}z_i,z_{i+1},\cdots,z_d) rac{dx_i}{1-x_i} \ - \operatorname{Li}_{n_1,\cdots,n_{i-1},n_{i+1},\cdots,n_d}(z_1,\cdots,z_{i-1},z_iz_{i+1},\cdots,z_d) rac{dx_i}{x_i(1-x_i)}$$

#### Remark 0.3.3.

Theorem 0.3.4. 
$$\operatorname{Li}_n(x) + (-1)^n \operatorname{Li}_n(x^{-1}) =$$

$$\begin{aligned} Proof. \ \ \mathrm{Li}_0(x) + \mathrm{Li}_0(x^{-1}) &= -1, \ \mathrm{Li}_1(x) - \mathrm{Li}_1(x^{-1}) = \pi i - \log x, \ \mathrm{Li}_2(x) + \mathrm{Li}_2(x^{-1}) = -\frac{\pi^2}{6} - \frac{\log^2(-x)}{2} \\ d(\mathrm{Li}_n(x) + (-1)^n \, \mathrm{Li}_n(x^{-1})) &= (\mathrm{Li}_{n-1}(x) + (-1)^{n-1} \, \mathrm{Li}_{n-1}(x^{-1})) \frac{dx}{x} \end{aligned}$$

 $0.4. \text{ Li}_{1,1}$ 

# 0.4 Li<sub>1,1</sub>

$$\begin{aligned} \text{Li}_{1,1}(x,y) &= \int \frac{dy}{1-y} \frac{dx}{1-x} + \frac{d(xy)}{1-xy} \left( \frac{dy}{1-y} - \frac{dx}{x(1-x)} \right) \\ &= \int d\log(1-y) d\log(1-x) + d\log(1-xy) d\log \frac{x(1-y)}{1-x} \\ &= \int dv_2 dv_1 + dv_{12} dw_1 \end{aligned}$$

To compute the monodromy around x=0, take  $q(\epsilon)$  to be the loop  $(x=\epsilon e^{it},y=\epsilon)$ , we get 0. To compute the monodromy around y=0, take  $q(\epsilon)$  to be the loop  $(x=\epsilon,y=\epsilon e^{it})$ , we get 0. To compute the monodromy around x=1, take  $q(\epsilon)$  to be the composition of  $(x=(1-t)\epsilon+t(1-\epsilon),y=\epsilon)$ ,  $(x=1-\epsilon e^{it},y=\epsilon)$  and  $(x=(1-t)(1-\epsilon)+t\epsilon,y=\epsilon)$ , we get 0. To compute the monodromy around y=1, take  $q(\epsilon)$  to be the composition of  $(x=\epsilon,y=(1-t)\epsilon+t(1-\epsilon))$ ,  $(x=\epsilon,y=1-\epsilon e^{it})$  and  $(x=\epsilon,y=(1-t)(1-\epsilon)+t\epsilon)$ , we get  $-2\pi i \operatorname{Li}_1(x)$ . To compute the monodromy around xy=1, take q to be the loop  $(x=x^0,y)$  such that  $\int_q d\log(1-xy)=2\pi i$ , we get  $-2\pi i \operatorname{Li}_1(\frac{1-xy}{1-x})$ 

The variation matrix is

$$\lim_{\epsilon \to 0} \int_{q(\epsilon)p(\epsilon)} - \int_{p(\epsilon)} = \int_q dv_2 \int_p dv_1 (du_1)^{n-1} = -2\pi i \operatorname{Li}_n(x)$$

To compute the monodromy around xy = 1, take q to be the loop  $(x = x^0, y \text{ such that } \int_q d \log(1 - xy) = 2\pi i)$ 

$$\begin{split} \lim_{\epsilon \to 0} \int_{pq} - \int_{p} &= \sum_{k=0}^{n-1} \int_{p} dv_{12} (du_{12})^{k} \int_{q} (du_{12})^{n-1-k} dv_{2} + \int_{q} dv_{12} du_{12}^{n-1} dv_{2} \\ &= (-1)^{n+1} \int_{q^{-1}} dv_{2} du_{2}^{n-1} dv_{12} \\ &= (-1)^{n+1} \int_{q^{-1}} \frac{\operatorname{Li}_{n}(y) - \operatorname{Li}_{n}(y^{0})}{y - 1/x^{0}} \\ &= (-1)^{n} 2\pi i (\operatorname{Li}_{n}(y^{0}) - \operatorname{Li}_{n}(1/x^{0})) \end{split}$$

The variation matrix is

 $0.10. \text{ Li}_{4,1}$ 

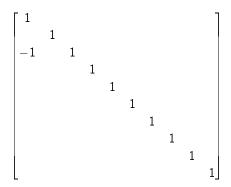

The monodromy representation  $\rho$  is as follows For monodromy around x=0

For monodromy around y = 0

For monodromy around x = 1

For monodromy around y = 1

For monodromy around xy = 1

 $0.11. \text{ Li}_{N,1}$ 

### **0.11** $\text{Li}_{n,1}$

$$\mathrm{Li}_{1,1}(x,y) = \int_{(0,0)}^{(x,y)} dv_2 dv_1 + dv_{12} dw_{1,2}$$

Here  $w_{1,2} = u_1 + v_2 - v_1$ , then

$$\mathrm{Li}_{n,1}(x,y) = \int_{(0,0)}^{(x,y)} (dv_2 dv_1 + dv_{12} dw_{1,2}) (du_1)^{n-1} + dv_{12} \left( \sum_{k=1}^{n-1} du_{12}^k dv_2 (du_1)^{n-1-k} 
ight)$$

since inductively

$$egin{aligned} \operatorname{Li}_{n,1}(x,y) &= \int_{(0,0)}^{(x,y)} \operatorname{Li}_{n-1,1}(x,y) du_1 - \operatorname{Li}_n(xy) dv_2 \ &= \int_{(0,0)}^{(x,y)} \left[ (dv_2 dv_1 + dv_{12} dw_{1,2}) (du_1)^{n-2} + dv_{12} \left( \sum_{k=1}^{n-2} du_{12}^k dv_2 (du_1)^{n-2-k} 
ight) 
ight] du_1 \ &+ dv_{12} (du_{12})^{n-1} dv_2 \end{aligned}$$

Suppose p is the path from (0,0) to (x,y) that give the value of  $\text{Li}_{n,1}(x,y)$ , q is a loop based at (x,y) that induces monodromy, we can take p to  $p(\epsilon)$  to start at  $(\epsilon,\epsilon)$  and then take limit  $\epsilon \to 0$ , then pq can be homotopied to some  $q(\epsilon)p(\epsilon)$ 

To compute the monodromy around x = 0, take  $q(\epsilon)$  to be the loop  $(x = \epsilon e^{it}, y = \epsilon)$ 

$$\lim_{\epsilon \to 0} \int_{q(\epsilon)p(\epsilon)} - \int_{p(\epsilon)} = 0$$

To compute the monodromy around y = 0, take  $q(\epsilon)$  to be the loop  $(x = \epsilon, y = \epsilon e^{it})$ 

$$\lim_{\epsilon \to 0} \int_{q(\epsilon)p(\epsilon)} - \int_{p(\epsilon)} = \int_{q} dv_2 \int_{p} dv_1 (du_1)^{n-1} = 0$$

To compute the monodromy around x=1, take  $q(\epsilon)$  to be the composition of  $(x=(1-t)\epsilon+t(1-\epsilon),y=\epsilon)$ ,  $(x=1-\epsilon e^{it},y=\epsilon)$  and  $(x=(1-t)(1-\epsilon)+t\epsilon,y=\epsilon)$ 

$$\lim_{\epsilon \to 0} \int_{q(\epsilon)p(\epsilon)} - \int_{p(\epsilon)} = 0$$

To compute the monodromy around y=1, take  $q(\epsilon)$  to be the composition of  $(x=\epsilon,y=(1-t)\epsilon+t(1-\epsilon)), (x=\epsilon,y=1-\epsilon e^{it})$  and  $(x=\epsilon,y=(1-t)(1-\epsilon)+t\epsilon)$ 

$$\lim_{\epsilon \to 0} \int_{q(\epsilon)p(\epsilon)} - \int_{p(\epsilon)} = \int_q dv_2 \int_p dv_1 (du_1)^{n-1} = -2\pi i \operatorname{Li}_n(x)$$

To compute the monodromy around xy = 1, take q to be the loop  $(x = x^0, y \text{ such that } \int_q d \log(1 - xy) = 2\pi i)$  First it's easy to show inductively

$$\int_{(x^0,y^0)}^{(x,y)} dv_2 du_2^{n-1} = \mathrm{Li}_n(y) - \sum_{k=1}^n \frac{(\log y - \log y^0)^{n-k}}{(n-k)!} \, \mathrm{Li}_k(y^0)$$

Thus

$$\begin{split} \lim_{\epsilon \to 0} \int_{pq} - \int_{p} &= \sum_{k=0}^{n-1} \int_{p} dv_{12} (du_{12})^{k} \int_{q} (du_{12})^{n-1-k} dv_{2} + \int_{q} dv_{12} du_{12}^{n-1} dv_{2} \\ &= (-1)^{n+1} \int_{q^{-1}} dv_{2} du_{2}^{n-1} dv_{12} \\ &= (-1)^{n+1} \int_{q^{-1}} \frac{\operatorname{Li}_{n}(y) - \sum_{k=1}^{n} \frac{(\log y - \log y^{0})^{n-k}}{(n-k)!} \operatorname{Li}_{k}(y^{0})}{y - 1/x^{0}} dy \\ &= (-1)^{n} 2\pi i \left( -g_{n}(x^{0}, y^{0}) - \operatorname{Li}_{n}(1/x^{0}) \right) \end{split}$$

Where

$$g_m(x,y) = \sum_{k=1}^m (-1)^{k+1} rac{\log^{m-k}(xy)}{(m-k)!} \operatorname{Li}_k(y)$$

The variation matrix is

$$dg_m(x,y) = g_{m-1}(x,y)du_1 - rac{\log^{m-1}(xy)}{(m-1)!}dv_2$$

Justifies the differential equation  $d\Lambda = \omega \Lambda$ Monodromy of  $\log^m x/m!$  around x=0 is

$$\sum_{k=0}^{m-1} \frac{\log^k x}{k!} \frac{(2\pi i)^{m-k}}{(m-k)!}$$

Monodromy of  $\log^m(xy)/m!$  around x=0 is

$$\sum_{k=0}^{m-1} \frac{\log^k(xy)}{k!} \frac{(2\pi i)^{m-k}}{(m-k)!}$$

Monodromy of  $\text{Li}_n(x^{-1})$  around x = 0 is  $2\pi i \log^{n-1}(x^{-1})/(n-1)! = (-1)^{n-1} 2\pi i \log^{n-1}(x)/(n-1)!$ 

Monodromy of  $g_n$  around x = 0 or y = 0 is

$$\begin{split} \sum_{k=1}^{m} \sum_{l=1}^{m-k} (-1)^{k+1} \operatorname{Li}_{k}(y) \frac{\log^{m-k-l}(xy)}{(m-k-l)!} \frac{(2\pi i)^{l}}{l!} &= \sum_{l=1}^{m} \sum_{k=1}^{m-l} (-1)^{k+1} \operatorname{Li}_{k}(y) \frac{\log^{m-k-l}(xy)}{(m-k-l)!} \frac{(2\pi i)^{l}}{l!} \\ &= \sum_{l=1}^{m-1} \frac{(2\pi i)}{l!} g_{m-l}(x,y) \end{split}$$

Monodromy of  $g_n$  around y = 1 is

$$2\pi i \sum_{k=1}^{m} (-1)^k \frac{\log^{m-k}(xy)}{(m-k)!}$$

0.11.  $Li_{N,1}$ 19

The monodromy representation  $\rho$  is as follows For monodromy around x = 0

For monodromy around y = 0

For monodromy around x = 1

For monodromy around y = 1

$$\begin{bmatrix} 1 & & & & & & \\ -1 & 1 & & & & & \\ & & 1 & & & & \\ & & -1 & 1 & & & \\ & & & \ddots & \ddots & & \\ & & & & & 1 & \\ & & & & -1 & 1 & \end{bmatrix}$$

For monodromy around xy = 1

$$\begin{bmatrix} 1 & & & & & \\ & 1 & & & & \\ -1 & & 1 & & & \\ & & & 1 & & \\ & & & & \ddots & \\ & & & & & 1 \end{bmatrix}$$

#### 0.12 Variation matrix

Theorem 0.12.1. A is the fundamental solution of the system of linear differential equations

$$d\Lambda = \omega \Lambda$$

Example 0.12.2. For

$$egin{aligned} ext{Li}_{1,1}(x,y) &= \int_{(0,0)}^{(x,y)} dv_1 dv_2 + dv_{12} d(u_1 - v_1 + v_2) \ &= \int_{(0,0)}^{(x,y)} dv_1 dv_2 + dv_{12} du_1 - dv_{12} dv_1 + dv_{12} dv_2 \end{aligned}$$

$$(0,0) < (0,1) < (1,0) < (1,1)$$
 in  $\mathfrak{S}(1,1)$ 

$$\Lambda = egin{bmatrix} 1 & & & & & \ \operatorname{Li}_1(y) & 1 & & & \ \operatorname{Li}_1(xy) & & 1 & & \ \operatorname{Li}_{1,1}(x,y) & \operatorname{Li}_1(x) & \operatorname{Li}_1\left(rac{1-xy}{1-x}
ight) & 1 \end{bmatrix} au_{1,1}(2\pi i)$$

$$\omega = egin{bmatrix} 0 & & & & & & \ -dv_2 & 0 & & & & \ -dv_{12} & 0 & 0 & & 0 \ 0 & -dv_1 & d(-u_1+v_1-v_2) & 0 \ \end{pmatrix}$$

Example 0.12.3. For

$$egin{aligned} ext{Li}_{2,1}(x,y) &= \int_{(0,0)}^{(x,y)} (dv_1 dv_2 + dv_{12} d(u_1 - v_1 + v_2)) du_1 + dv_{12} d(u_1 + u_2) dv_2 \ &= \int_{(0,0)}^{(x,y)} dv_1 dv_2 du_1 + dv_{12} du_1 du_1 - dv_{12} dv_1 du_1 \ &+ dv_{12} dv_2 du_1 + dv_{12} du_1 dv_2 + dv_{12} u_2 dv_2 \end{aligned}$$

$$(0,0)<(0,1)<(1,0)<(1,1)<(2,0)<(2,1) \ \mathrm{in} \ \mathfrak{S}(2,1)$$

# 0.13 Bloch-Wigner polylogarithm

**Definition 0.13.1.** The Bloch-Wigner polylogarithm is defined as

$$\mathcal{L}_n(z) = \Re_n \left( \sum_{r=0}^{n-1} rac{2^r B_r}{r!} \operatorname{Li}_{n-r}(z) \log^r |z| 
ight)$$

Here  $\Re_n$  is Re if n is odd and Im if n is even.  $B_n$  are Bernoulli numbers. For instance,  $\mathcal{L}_1(z) = 1$ ,  $\mathcal{L}_2(z) = \operatorname{Im}(\operatorname{Li}_2(z)) + \operatorname{Im}(\log(1-z)) \log |z|$ 

**Lemma 0.13.2.** 
$$\mathcal{L}_n(z) + (-1)^n \mathcal{L}_n(z^{-1}) = 0$$
.  $\mathcal{L}_3(z) + \mathcal{L}_3\left(\frac{1}{1-z}\right) + \mathcal{L}_3(1-z^{-1}) = \zeta(3)$ .  $\mathcal{L}_2(z) - \mathcal{L}_2\left(\frac{1}{1-z}\right) = 0$ 

Proof.

# 0.14 Hopf algebra structure

**Definition 0.14.1.** Iterated integrals form a Hopf algebra H with coproduct

$$\Delta I(a_0;a_1,\cdots;a_n;a_{n+1}) = \sum_{0=i_0 < i_1 < \cdots < i_k < i_{k+1} = n+1} I(a_{i_0};a_{i_1},\cdots,a_{i_k};a_{i_{k+1}}) \otimes \prod_{p=1}^k I(a_{i_p};a_{i_p+1},\cdots,a_{i_{p+1}-1};a_{i_{p+1}})$$

The product is the just shuffle product,  $\Delta_{i_1,\cdots,i_k}$  means those in grading  $(i_1,\cdots,i_k)$ .  $\Delta'(x)=\Delta(x)-1\otimes x-x\otimes 1$  is the reduced coproduct. The space of indecomposables  $Q(H)=H/(H_{>0}+H_{>0})$  is mod products. The projection  $\frac{1}{n}R=P:H\to Q(H)$ , where R is defined inductively as  $R(x)=nx-\mu(1\otimes R)\Delta'(x)$ ,  $\mu$  is multiplication. The cobracket is defined as  $\delta(x)=(P\otimes P)(1-\tau)\Delta(x)$ ,  $\tau(x\otimes y)=y\otimes x$ 

Symbol of a multiple polylogarithm is defined to be  $\Delta_{1,\dots,1}(x)$ , and omit log sign
